

Exercise title

EX-WPFRestClient-Phase8

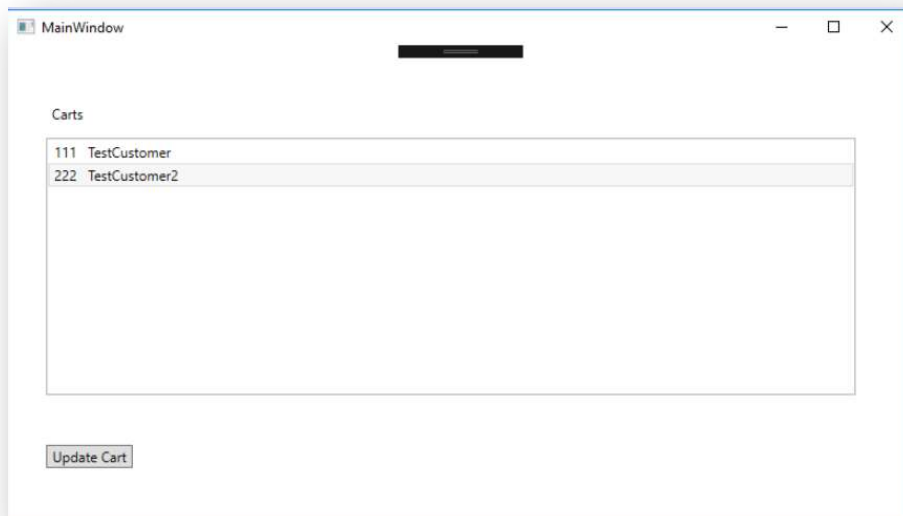

Type of Application

WPF Application

Overview

You are to create a WPF application that acts as a REST client for a Shopping Cart API. The shopping cart REST service application is provided and I'll show you how it works.

The WPF client application will display a list of Shopping Carts as follows and allow a user to select one of the carts and update it.

The selects a cart and presses the **Update Cart** button. The user then sees an interface that shows all the details of one cart. They should be able to:

- Change the Customer Name (but not the cart number)
- Add Items
- Delete Items
- Change Items (but not the item number)
- Save the updated cart to the REST API

CartWindow

222

TestCustomer2

1	Dummy ItemA2	22	66
2	Dummy ItemB2	77	99

Add Item Delete Item

Save Cart

Clues:

- Your previous Console REST client solutions (phase1-5).
- Use *Data Binding*. See my Demo,
